

# Forest Health Highlights 2000

## Mississippi

The Mississippi Forestry Commission provides forest health protection assistance to state and private land managers within the State. The State and the USDA Forest Service Forest Health Protection unit fund this program cooperatively.

### Mississippi Forest Facts

- Over **60%** of Mississippi is **forested** (more than 18.5 million acres).
- Nearly **90%** of forested acreage in Mississippi is **privately owned**.
- The **National Forests in Mississippi** (1.1 million acres) provide recreational and wildlife benefits as well as forest products and jobs for thousands of people.
- The **southern pine beetle** (SPB) is Mississippi's most important forest insect pest. In 1995 a major outbreak occurred, over 11,000 spots were detected on state, private and federal forestlands in 26 epidemic counties affecting over 2.5 million forested acres. Cooperative activities carried out on these lands materially contributed to the SPB population collapse in 1996. Since that time SPB populations have remained moderate to low. In 2000 low levels of SPB activity continued with 809 spots detected. Only three counties were considered to be epidemic. It is projected that in 2001 populations will be at moderate levels.
- Surveying for the **gypsy moth** continues throughout the state. No infestations were detected in 2000.
- Pine colaspis beetle damage occurred on some 9,000 acres in Carroll and Hemphill counties. These beetles damage the needles of southern pine causing them to turn brown and many fall.
- The Mississippi Forestry Commission and Mississippi State University are working with forest industry to develop an **integrated pest management practices for cottonwood plantations** in the Delta section of the state

## The Mississippi Forestry Commission and the USDA Forest Service

In spite of the relatively good health of Mississippi's forests, a variety of insects and diseases (both native and introduced), and human-caused impacts such as air pollution, continue to threaten the State's resources. To deal with this constantly changing mix of challenges, the Mississippi Forestry Commission and the Forest Health Protection unit of the USDA Forest Service cooperate to prevent, detect, suppress and manage this multitude of threats. The partnership between the two agencies has worked for three decades to maintain and improve the health of Mississippi's forests.
